Exp: 11 Examine Network Address Translation (NAT) using cisco packet tracer.

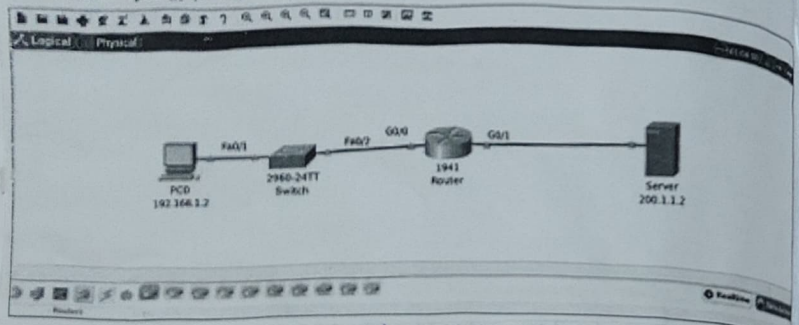

AIM:

To configure and examine NAT and verified communication between private network and public network.

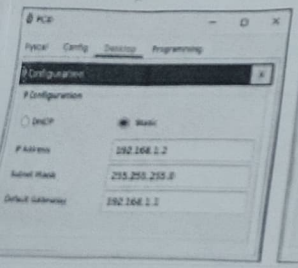

PROCEDURE:

- Open cisco packet tracer and add a router, switch, PC and server.
- Connect the device using appropriate cables.
- Configure IP address for the PC, router interface and server.
- Configure the router's inside and outside NAT interface.
- Create NAT configuration translate private IP address into public IP address.
- Configure the necessary routing and NAT rules
- Test communication b/w the private network and public network using ping.
- Verify the translation and statistics using show IP at translations and show ip nat statistics.

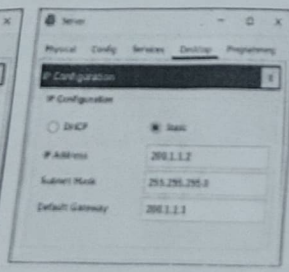

1. Network Topology (Final)

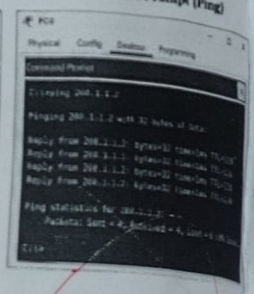

2. PC0 IP Configuration

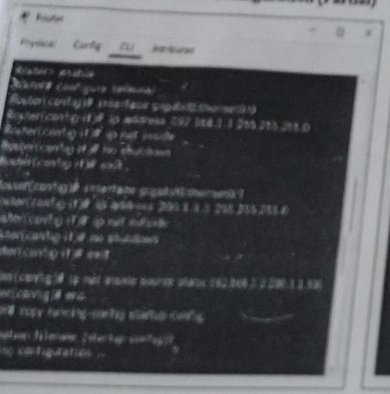

3. Server IP Configuration

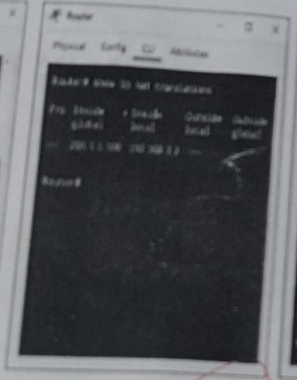

4. PC0 Command Prompt (Ping)

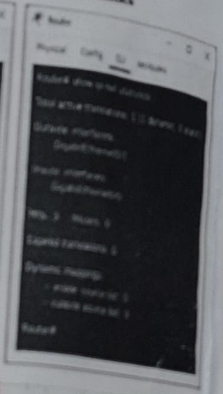

Router CLI – Interface Configuration (Partial)

6. NAT Translation Table

7. NAT Statistics

#4

Result:

NAT was configured and examined and communication between the private and public network was tested.
