

LEARNING AND ASSIGNMENT OF IP ADDRESS MANUALLY TO COMPUTERS

Aim:

To understand ip addressing scheme of manually assign static ip address to computers on a network

THEORY:

An IP (internet protocol) address is a unique numerical label assigned to each device connected to a computer network.

IPV4 address are 32-bit numbers written in dotted - decimal notation.

(Eg 192.161.1.10)

IPV6 uses 128-bit address.

Manual (static) IP assignment is used for servers & network devices requiring a permanent address. DHCP assigns IP's dynamically

CODE

<Bash>

Sudo ip addr add 192.168.1.10/24 dev eth0.

sudo ip route add default via 192.168.1

ip addr show eth0.

ping -C 4 192.168.1.1

gedit nmcli con mod "wired connection IPV4 address 192.168.1.10

sudo nmcli con mod "wired connection"
ipv4 gateway 192.168.1.1

sudo nmcli con mod "wired connection"
ipv4 method manual

sudo nmcli con mod "wired connection"
ipv4.dns "8.8.8.8"

sudo nmcli con up "wired connection"

RESULT:

Static IP address was successfully assigned to computer connected to wired network using ping commands between hosts on the same subnet.
