EXPERIMENT-6

BUILDING AN ANONYMOUS FTP SCANNER USING PYTHON

Aim:

To develop a Python-based anonymous FTP scanner using the built in ftplib module and determine whether an FTP server permits anonymous access.

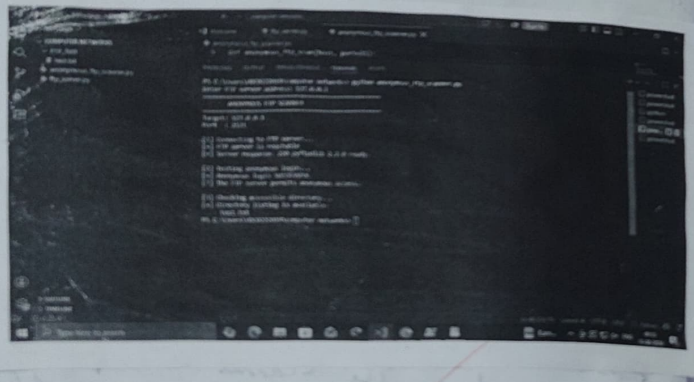

REQUIREMENTS:

- Windows / Linux Computer
- Python 3.x
- Python Built in ftplib module
- Authorized FTP server.
- Network connection

THEORY:

FTP (File Transfer Protocol) is used to transfer files between computers. Python's ftplib module provides functions to connects to FTP servers, login, list files and close connections. The scanner attempts to login using the username anonymous. If successful the server permits anonymous FTP access.

1. Import FTP and all_errors from ftplib.
2. Get the FTP server address from the user.
3. Connect to the server welcome message.

5. Attempt anonymous login.
6. If login succeeds, display the directory listing.
7. If Login fails, check the error.
8. Close the FTP connection.

RESULT:

The anonymous FTP Scanner was successfully implemented. It identifies whether the authorized FTP server allows anonymous access and displays the accessible files/directories.
